

1. Please make sure you have two folders in the same directory where you have the script "ScrapAndFill.py". First one should be named "Input" and the second one should have the name "Output".
2. Keep all the files that the script has to scrap in the "Input" folder.
3. Open the command prompt in the same directory and use the following command to run the script.
4. Command to run the program
`python ScrapAndFill.py`
5. You will see that the data has been scrapped from the files in the "Input" folder and the corresponding files have been created in the "Output" folder.
